INCAP HKC P

Better Pools from Start to Finish

We make pools better by improving the plaster – so pool plasters are easier to apply and can maintain their appearance even under some of the most severe conditions.

Colour changes, surface imperfections and areas of weakness in plaster can result when lime, created as an undesirable by-product of cement hydration, leaches from the hardened plaster. But now there's

INCAP HKC P is a high quality pozzolanic plaster additive that's uniquely engineered to react with lime to form additional cementitious products, resulting in a more durable plaster finish. In addition, INCAP HKC P pozzolanic additive produces a plaster with a creamy texture, improving the plaster's trowelability, making it easier to apply and finish.

Results show INCAP HKC P pozzolanic additive reduces permeability and improves surface appearance in hardened plaster. Not to mention it has a white colour for architectural applications – perfect for white and coloured plaster and all exposed aggregate finishes.

INCAP HKC P

Pozzolanic Additive can:

Increase Production

- Improve trowelling
- Reduce bleed water
- Decrease finishing time

Improve Surface Appearance

- Maintain high whiteness
- Reduce spot-etching
- Reduce cracking
- Reduce mottling
- Reduce efflorescence
- Reduce colour pigment "fade"

Improve Performance

- Improve aggregate bonding
- Increase chemical resistance
- Reduce permeability
- Increase strength
- Reduce alkali-silica reactivity
- Lower alkalinity in start-up
